

November 08, 2020

Goals

- Jordan
 - Keep up with project milestones
 - Figure out what roles everyone on the team wants
 - Figure out how much everyone else on the team wants to contribute
 - Set up database with dummy data
- Jacob
 - Practice with SQLite and flask implementation
 - Find my niche within the group
 - Practice with front end design
- Bernard
 - Kept up with the project milestones from this past week
 - Want to get the features established for the future
 - Keep completing dummy webpages with different features for practice
- Robert
 - Dust off rusty python skills
- Abdullah
 - Our goals from last week were to continue to hit our deliverables on time and progress through the project.

This Week's Progress

- Jordan
 - We've mostly decided on what positions everyone wants
 - I've had contact with everyone and seen contributions from everyone. Participation looks like it'll be fine
 - [Set up the database.](#)
- Jacob
 - Practiced with SQLite and SQLAlchemy
 - Assigned myself to multiple backend features
 - I worked on the story board consisting of user stories for our features.
 - I learned more about front end design.

- Bernard
 - Got more familiar with the github repo
 - Finished the wireframes and user stories
 - Worked with abdullah to discuss potential front end designs
- Robert
 - Talked with group about how to set up database
 - Python getting better
- Abdullah
 - This week we discussed various aspects of our project during the class meeting.
 - We also got the chance to assign ourselves to different issues on our github. This was a big step because we were able to individually select issues that we are capable of resolving and helped us visualize all the different pages our application will require.
 - We also made user stories for this weeks deliverable.

Next Week's Goals

- Jordan
 - Add user tables
 - Figure out design for user privileges
 - Set up more subtasks
 - Automate a deploy to the raspberry pi
- Jacob
 - Start working on the database
 - Start implementing functions
 - Decide as a group on how to implement the database.
 - Work on data flow diagram
- Bernard
 - Keep making more dummy pages for practice
 - Work on the data flow diagrams for next week
 - Start looking for what features we are gonna want to have
- Robert
 - Set up database
 - more back-end stuff

- Abdullah
 - Goals for next week are to collaborate with Bernard on finalizing a visual design for our application, as we are the front end guys.
 - Another goal is to start resolving Github issues that we assigned ourselves to. This will get us in motion toward a legit product.
 - Another goal is to have successful meetings during class this week and continue to progress.

Meeting Agenda

- Do we need an admin panel for administrative tasks?
- Would you like us to keep the same color scheme as the practice examples?
- Can we use sqlalchemy so interface with the sqlite database?
